

Western Snowberry

Photo by the late Dr. W. C. McCalla

Symphoricarpos occidentalis Hook.

The Western Snowberry is a common shrub around aspen groves and on dry grassy hillsides. The plants are stoloniferous and occur in dense clumps from 2-4 feet high. The flowers are pink and white and the berries are white. Like the other plants mentioned in the plant section of this **Blue Jay** the Western Snowberry can easily be found in the region south of Beechy where we plan to hold our Summer Meeting, June 5-7, 1964.
