SASKATCHEWAN CHRISTMAS MAMMAL COUNT — 1991

Compiled by WAYNE C. HARRIS, Box 414, Raymore, Saskatchewan. S0A 3J0

Interest in mammal counts increased this year after stabilizing for the past five years. The number of counts increased to 82 from 65 last year, exceeding the previous high of 70 set in 1987. Of the record 44 species (exceeding last year's 39), 3 were never before recorded on a Christmas Mammal Count. All of these new species are from the grasslands of the southwest, Black-tailed Prairie Dog, Sagebrush Vole and Swift Fox.

Hundreds of Black-tailed Prairie Dogs were seen on the Grasslands National Park count. The weather was unseasonably cold in October and November, but temperatures throughout early December were very warm with many days above freezing. This obviously prematurely ended the normal hibernation period. The Grasslands National Park and immediate vicinity is the only place in Canada where prairie dogs are found.

The first count record for the Sagebrush Vole was one found hanging on a barb wire fence (shrike kill?) on the Glentworth count. Although the population status and distribution of this species is not well defined, this is not an unexpected species for this area.

Both count areas that recorded the Swift Fox have been subject to re-introduction programs in recent years; these records are undoubtedly a result of this program. The Swift Fox was considered extirpated from the Canadian plains prior to the re-introduction.

Other species are infrequent enough to warrant mention. The Short-tailed Shrew at Squaw Rapids is only the second since the count began. Both the Lynx and the Woodland Caribou were reported for

the second year in a row after a long absence from the count reports. In the case of the Lynx this appears to be a result of a population resurgence but the caribou is from northern counts; although there are several counts from the areas where they occurred in the past they remain unreported from the southern forest.

White-tailed Deer was still the most frequently recorded species, but numbers appear to be down as do numbers for Snowshoe Hare, White-tailed Jack Rabbit and Nuttall's Cottontail. Coyote and Red Fox numbers appear to be up; the Coyote was the second most common species.

For weather, coverage and participants please refer to the Christmas Bird Count found in this issue. Numbers appearing before the count location name in the tables refer to the location of the count on the map included with the bird count; the numbers are not consecutive because not all bird counts submit information on mammals. In the tables a numeral alone indicates that the animals were actually seen, while a letter prior to the number indicates that the numbers were inferred by the means defined below. A letter alone indicates that the species was present but it was either impossible to estimate numbers or no attempt was made to do so.

T = tracks

L = active lodge or hut

D = dead animal found

d = fresh diggings found

S = odour or smell

H = heard

+ = present during the count period (Dec. 14 to Jan. 2) but not found on count day.
