

FOURTH OF JULY BUTTERFLY COUNTS IN SASKATCHEWAN – 1997 - 1999

J. B. GOLLOP¹

The 25th annual 4th of July Counts (4JCs) – the only international survey of butterflies in Canada, the United States and Mexico – were held in 1999. They are organized by the North American Butterfly Association and are usually conducted within a month of 4 July. Like Christmas Bird Counts, they are 1-day counts done within a 24-km-diameter circle. With the bird counts, 10 or more parties are usual per count in much of the continent so that each area is thoroughly surveyed. Saskatchewan's 1-3 parties per butterfly count can only handle a fraction of the circle. 4JCs are also comparable to Breeding Bird Surveys (BBS) in that they are 1-day counts at the peak of the breeding season, although the BBS is conducted along a 25-mile route, half a mile wide and one observer spends three minutes at each of 50 stops to record all birds seen *and heard*. It occupies 12.5 sq mi compared to the 177 for the circle.

Like the BBS, a 4JC is not an adequate indicator of the animal population that year because all species are not at their peak on any one day (some butterflies have even disappeared as a species for the year and others have not yet arrived) and because weather significantly affects counts from year to year in both cases. For birds, the saving grace is the number of counts which, when combined, helps to offset (or mask) some of the

deficiencies of a single count. There have been about 30 BBSs in Saskatchewan compared to 12 4JCs. Alberta has gone from three 4JCs in 1997 to 13 in 1998 to 28 in 1999. When Saskatchewan reaches that level, we'll be in much better shape.

All of which points to the need for more butterfly surveys in Saskatchewan. The best evaluation of birds or butterflies at a given site, regardless of size or shape, is repeated counts through the season. For birds, with practically all species being present throughout the breeding season, the minimum number per season is considered to be eight counts. Because butterfly species have shorter life spans with few being present all summer, more counts are desirable. For butterflies, counts at two-week intervals from April through September along a km of lane or trail, or checking several flower gardens or crisscrossing a piece of native habitat would be superb - 12 counts for a perfect record (but something - even if you can't identify all species - is infinitely better than nothing).

Which just about gets us to Table 3 - Saskatchewan 4JCs for 1997 through 1999. The table of 1998 and 1997 data in *Saskatchewan Butterflies 1998* should be ignored because there were several errors in it. This year's table is a little closer to perfection.

jbg15may2000

* 1989 & 1986 include Waskestu River (not done in 1997)

** Anise/Old World Swallowtail except for Sonningdale where it could also be Kahli.

jbg13may2000

Explanation

The conditions under which each count was conducted are presented in *Table 3A* - date, time, # of observers & weather - as well as some of the results - numbers of species, butterflies, party-hours (ph), party-km & butterflies/party hour. The results for each count are in *Table 3B*. The sequence for number of butterflies is 1999, 1998, 1997. Totals for 1999 and 1998 are for 12 counts; 1997 is for 11 (the Waskesiu River count started in 1998). The six species found in 1999 and 1998 only at Waskesiu River are designated by a *dash* in the 97 column.....Group names (genus & family because of no more precise identification) are in *italics*; they do not count as a species unless no other member of that group was found on the 4JC.....A small "c" means that at least one copulating pair was noted.....*Dark (black)* Swallowtail is either an Old World or Anise Swallowtail, except at Sonningdale where it could also be a Kahli Black Swallowtail.....For *Northwestern Fritillary* at Eastend, B = Bean's Northwestern Fritillary & N = Northern Northwestern.

Discussion of totals for the 12 4JCs

The number of species for 1999 was 69, 11 fewer than 1998 and 8 fewer than in 1997 (even with one less 4JC - Waskesiu) - another indication that 1999 was not a good year for butterflies in Saskatchewan. Fifteen species found in *both* 1998 and 1997 were not reported in 1999: Afranius Duskywing, Nevada and Tawny-edged skippers, Mustard White, Orange and Pink-edged sulphurs, Ruddy Copper, Striped Hairstreak, Lupine (once Acmon) Blue, Zerene, Callippe, Atlantis and Mormon fritillaries, Compton Tortoiseshell and Painted Lady - heavy on fritillaries.

The greatest decreases for species reported in 1999 from 1998 involved 11

species: Garita Skipperling (71 in 1999 vs. 187 in 1998), Common Roadside Skipper (9 / 31), Western White (23 / 181), Cabbage White (33 / 119), Eastern Pine Elfin (6 / 32), Greenish Blue (64 / 231), Great Spangled Fritillary (30 / 116), Silver-bordered Fritillary (7 / 41), Arctic Fritillary (9 / 107), Northern Crescent (96 / 419) and Red Admiral (6 / 66).

Major increases in numbers for 1999 over 1998 involved eight species: Common Checkered Skipper (112 in 1999 vs 47 in 1998); Olympia Marble (20 / 0, apparently due to a corresponding flower ratio for the 2 years), Pearl Crescent (56 / 19), Northern Pearly-eye (51 / 15), Little Wood Satyr (30 / 9), Common Ringlet (579 / 156), Uhler's Arctic (138 / 7) and Monarch (17 / 2).

One segment of the Waskesiu River 4JC was not done because Mike Gollop turned a corner and found he was following a bear. No dedication!
