American Goldfinch	Clark's Crossing (1), Craven (3), Fort Qu'Appelle (9), Kenosee Lake (6), Regina(5), Whitewood(2)

Burrowing Owl photographed on the grounds of the Saskatchewan Burrowing Owls Interpretive Centre in Moose Jaw in August 2003. The various color combinations of leg bands aid in identifying individual birds from a distance through binoculars or a spotting scope.

Brian K. Jeffery

MYSTERY PHOTO

JUNE 2004 MYSTERY PHOTO

These two, fist-sized chicks, were photographed in their natural setting near Weyburn, SK in early July 2003. Can you guess what species of bird these are?

ANSWER TO MARCH MYSTERY PHOTO

The translucent strands are strings of toad eggs which formed large masses in a shallow, prairie slough 12 km east of Liebenthal on June 12, 2003. From a distance, the mass of eggs resembled a mat of algae but a closer look reveals the developing toads inside the translucent strands.

The editors would like to thank Michelle Lanoie for taking the photograph and making it available to *Blue Jay*.
