

A winter bird common to the Prairies is the Bohemian Waxwing. Watch for him.

FEATHERED FRIENDS IN SEPTEMBER

Doug Gilroy, Regina

During the month of September we had quite a heavy migration of Killdeer Plovers over the farm. Some days down on the pasture flat I counted fifty or more birds together. There also seems to be more Flickers about this fall than there were last year. They certainly were not hatched in this area, as Starlings occupied most of the Flicker holes.

September 21 was a beautiful warm autumn day. On the way to a neighbors that morning we passed the bridge and on up the road that leads out of the valley. I counted 6 large Swainson Hawks sitting out in the stubble field and on fence posts along the trail. About two miles further on we came upon more hawks out in the stubble. This time I counted 35 and there were still several more over a slight rise in the land. I'm sure it would be quite safe to say there were at least 40 in the flock. About 20 got up at once and flew off a short distance together. It was indeed a great sight to see so many of these fine birds together at once.

Going on down the road a mile or so we came upon four Chickadees looking very much out of place on the treeless prairie. One little fellow would fly from telephone pole to telephone pole and alight on the side of each one, like a woodpecker. At twelve o'clock, we arrived back home to find our pasture absolutely black with Crows. There were thousands of them - the largest flock of crows I have seen this year.

CROWS AND DUCKS WERE PLENTIFUL

Harold Kvinge, Hawarden

There was a huge flock of crows flying in a south-easterly direction from out farm on September 10. I estimated that there were between 10,000 and 20,000 in the flock. I have never seen such a large flock before. They were migrating ahead of a storm wave. The sky seemed all black with them for quite a distance.

Wild ducks are still (November 8) around here in large numbers. I believe the flock to be between a thousand to two thousand birds. They remained here after the cold weather and freeze-up of October 20. They are now feeding on grain in the fields each night by the light of the moon. The sloughs are open again and there is no snow here.

Fall birds seem more numerous this fall, especially the Red Poles which congregate in large flocks in many places. Chickadees and Snowbirds are quite prevalent now, and a few Pine Grosbeaks have put in an appearance. During the first week in September I noticed the following birds in migration: on the
